

Serum albumin rises linearly with total protein

Pearson $r = 0.78$ ($p < 0.001$), $n = 583$

Least-squares line: $\text{Albumin} = -0.58 + 0.57 \times \text{Total protein}$, $R^2 = 0.61$

Points are slightly jittered because values are recorded to one decimal place. Grey band = 95% confidence interval of the line.
